

Conduit 20Mm Recycled Hdpe - 2M

SKU: 6193-C20

Powerpac's 20mm Conduit, extending to a length of 2 meters, is a crucial component for formwork systems, specifically designed for concrete applications. It serves as a reliable spacer tube, providing precise clearance in formwork and facilitating a smoother construction process.

PRODUCT DESCRIPTION

Often used in concrete columns and retaining walls, this conduit allows Z bars or tie bars to pass through easily, thereby enabling the formwork to be tightened effectively. It often works in combination with cones, creating neat, flush openings at each end.

A key feature of this conduit is that it prevents grout from entering the tube, which facilitates easy removal of the Z bar when it's time to strip the forms. This contributes to an efficient and hassle-free process during both the construction and disassembly stages.

Provided in a standard 2-meter length, the conduit can be trimmed according to the thickness of the wall, ensuring a custom fit for every project. The external diameter of the conduit is 20mm, making it a versatile choice for various formwork setups.

Please note, the implementation of this conduit should adhere to safety regulations and guidelines specific to your construction project. Safety should always be prioritized in these installations.
